

# When you go, where does it go?

Down the drain, through pipes and pumping stations to our wastewater treatment plants.

**TIP!**  
Only flush toilet paper. Trash and wipes clog pipes and damage our equipment.

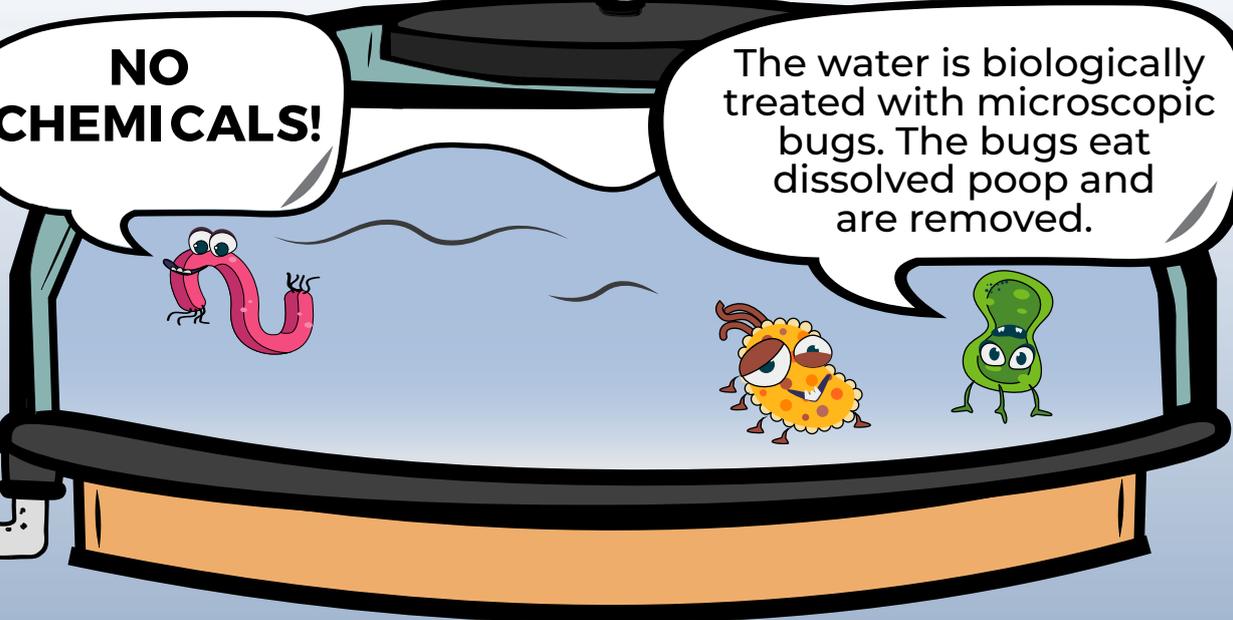

At the treatment plant we separate the waste from the water. The poop is sent to be made into fertilizer.

**NO CHEMICALS!**

The water is biologically treated with microscopic bugs. The bugs eat dissolved poop and are removed.

The clear water left over is disinfected with ultraviolet light and sent to the river; safe for fish and wildlife.
